

# N Queen problem

— by Backtracking

4

	1	2	3	4
row	1	2	3	4
column	1	2	3	4
diagonal	1	2	3	4

4x4

row  $(2, 3)$  col

$$(1, 1) \\ = 2 \\ = 0$$

$$2 + 3 = 5$$

$$(1, 4) = 1 + 4 = 5$$

$$2 - 3 = -1$$

$$(1, 2) = -1$$

S.S.T. - (state space tree)

$$Q_1 = (1, 2)$$

$$Q_2 = (2, 4)$$

$$Q_3 = (3, 1)$$

$$Q_4 = (4, 3)$$

## Algorithm for Nqueen problem

- 1 Initialize an empty chessboard size  $N \times N$ .
- 2 start with the leftmost column and place a queen in the first row of that column.
- 3 move to the next column and place a queen in the first row of that column.
- 4 Repeat step 3 until either all  $N$  queens have been placed or it is impossible to place a queen in the current column without violating the rules of the problem.
- 5 If all  $N$  queens have been placed, print the solution.
- 6 If it is not possible to place a queen in the current column without violating the rules of the problem, backtrack to previous column.
- 7 Remove the queen from the previous column and move it down one row.
- Repeat steps 4-7 until all possible configurations have been tried.
